Quality Early Educat

When an infant is born she has already developed around 100 billion neurons, or brain cells. While functions like breathing, heartbeat and others necessary for survival develop before birth; the majority of activity in the brain takes place from birth to the age of 10. After a child is born, the brain goes through a wiring process where brain cells connect through synapses, which form the mechanisms through which a child learns. A young child's brain produces more connections than it can possibly ever use. Then, around the age of 10, the brain goes through a pruning process whereby synapses that are rarely or never used are discarded, leaving behind a brain that is unique to that child'. But it is what happens between birth and three years of age that is the most remarkable, and crucial.

As early as two-months-old, an infant's brain has developed enough motor control to enable the infant to reach out and grab objects. An infant who is three-months-old has the ability to distinguish between several hundred spoken sounds and can distinguish between a parent and stranger based on smell and sight. At the age of 12 months, an infant is speaking her first words, reading the emotions of others and using more language to communicate. By the time the child reaches the age of three, her brain weight has tripled and the foundation is laid for all later learning². All of these synapses, or connections, are cultivated through stimulation from the infant's environment. Lack of stimulation in a particular area could have a detrimental effect on the rest of a child's life.

Experiences such as illness or abuse can negatively affect the brain development. However, experiences this extreme do not have to occur to potentially negatively affect a child's life. Everyday environmental stimulation, or lack thereof, can hold a child back from reaching their full potential too.

The Role of Quality Care

A child's brain cannot reach its full potential without the proper stimulation. Much like a pendulum that will not begin its consistent back-and-forth motion without outside help, a child's brain cannot begin the process of wiring and connecting without positive influences from her environment.

Several factors work together to ensure an early care environment that is developmentally appropriate and of the highest quality available.

First, the staff-to-child ratio must be low enough to ensure that children have the opportunity to receive individual attention and the risk of unsafe conditions is reduced. Moreover allowing child care staff to work with smaller groups of children will increase their ability to spend one-on-one time with the children, allow the staff to be more aware of potential dangers and prevent staff burnout due to stress and overwork. In an industry that has difficulty retaining quality staff due to resource and monetary constraints, it is important to protect the well being of the staff as well as the children with whom they work.

Second, staff must be well trained and educated. In order to provide developmentally appropriate activities to the children they serve, the staff must have early childhood knowledge. However, formal education, by itself, is not sufficient to meet the needs of children. Knowledge of various activities, such as play, music and arts and crafts are just as vital.

Finally, no early childhood program can be successful without the support of parents or guardians. Parents who have a better understanding of early childhood development as well as what the early care program is providing their children are better able to continue the positive aspects of the programming as well as advocate for higher quality care for their children.

While this list is not exhaustive, it is a good checklist of items necessary to build a strong foundation of a quality early care program.

What is the goal of the program? What are the needs of the children?

Every day in our state, 71% of children under the age of six wake up in a family where either the single parent or both parents work outside of the home. Therefore, by the time our children enter school, most of them will have been exposed to some sort of early care or child care setting.

Care on Services

This, of course, does not diminish the importance of strong parental involvement in the development of their children. Often times, however, parents do not know where to turn for information regarding their child's development. This is an area where an early childhood staff that is well-versed in the needs of our youngest children can step in and provide the necessary information to parents on the developmental patterns of their children as well as the role quality early care can play in protecting their children's future.

Shatecia, I

The State of Nebraska has already implemented important measures that lead to high quality early care services. Beginning in 2002, early care providers will be eligible to apply for continuing education funding through the TEACH program which provides scholarships for early care providers to study early childhood education at higher learning institutions across the state. In return, the early care provider receives an invaluable education and makes a commitment to continue in the field.

Promoting accreditation of early care providers is another important area on which Nebraska has focused. Accreditation is the process through which a provider is recognized for reaching and maintaining national standards of quality in early care and education. Nebraska's Department of Education's Office of Children and Families offers an Accreditation Enhancement Program whereby providers wishing to become accredited by a national organization can seek funding assistance for the accreditation process.

What else should Nebraska be doing to promote quality early care in this state? First, Nebraska needs to alter its staff-to-child ratio requirements to reflect national recommendations. In Nebraska, ratios are currently required to be maintained on a center-wide level, meaning that a teacher could be in a room alone with twelve 18-month-olds so long as a second teacher or assistant was somewhere in the building. Not only are children in this situation not receiving developmentally appropriate programming or necessary

individualized attention, the safety level decreases. Additionally, the teacher who is in the room is placed in the high-stress situation of caring for 12 toddlers alone.

Secondly, we must focus on staff retention and compensation issues. Across the country, the early care arena faced an average staff turnover rate of 30% between 1999 and 2000. Moreover, nearly 56% of centers facing turnovers are unable to replace all of the staff they lost due to the low compensation received by the early care workforce³. We must work as a state to find an answer to this problem that continues to cripple the early care arena and place our children's futures in jeopardy.

Since August of 2001 Voices for Children has been facilitating meetings of early care providers, advocates and state administration in an effort to find solutions for the issues plaguing our early care and education system. Action steps have already been developed in several areas, and we hope to continue our work to see those steps become a reality.

Domestic Sexual

Anonymous

During the year 2000, the Department of Health and Human Services (HHS) received 13,448 calls alleging child abuse and neglect. Of those calls, 8,254 were investigated resulting in 1,932 substantiations involving 3,074 children. This averages out to 159 investigations per week. The last two years, 1999 and 2000, show a decline in the number of children involved in substantiated cases. This decrease appears to be due to a change in how data is recorded by HHS through the N-FOCUS/CWIS database. The former computer system recorded all children in the household as victims when there was only substantiation for one child. N-FOCUS/CWIS only records the child or children whose abuse has been directly substantiated, it does not include other children in the home. HHS chose to capture the data to ensure that perpetrators who have maltreated one child are not identified as having maltreated others. However, studies show that children who witness violence may experience the same emotional damage and present the same behaviors as children who have been directly abused.

Data shows substantiated cases are more likely to involve younger children, than older children. In 2000, 1,863 (61%) of the children involved in substantiated cases were ages 0-8. The average age of a child in a substantiated case was 7.4. Children ages 0-3 represented 936 (30%) of the children involved in substantiated cases and children age 2 or under represented 738 (24%). Older children are not less likely to be abused but instead children who are younger often display stronger evidence of abuse and, therefore, it is more likely to be reported. In 2000 there were 1,553 female children and 1,495 male children involved in substantiated cases. According to hospital discharge records, males are the most probable perpetrators of physical abuse resulting in the need for medical assistance. In most cases these men are also the spouse or partner of the child's mother.

Domestic Violence & Assault

The State of Nebraska requires all citizens who suspect or have witnessed child abuse or neglect to report the incident to their local law enforcement agencies or to Child Protective Services (CPS). The State of Nebraska maintains a Hotline for reporting suspected abuse/neglect of children or adults that can be accessed 24 hours a day 7 days a week at 1-800-652-1999.

Only 1% of child abuse reports come from the children themselves. Children often have strong loyalties to their parent(s) and/or the perpetrator and therefore are not likely to report their own or their siblings' abuse or neglect. These children may fear the consequences for themselves, the perpetrator and/or their parent(s). There is also a strong possibility that the perpetrator has threatened more serious abuse if they tell.

Neglect, physical abuse and sexual abuse are the three main classifications that fall under the umbrella of child abuse. Because children may experience more than one form of abuse, HHS records all types of abuse that apply to each child individually. Over the years, neglect has been found to be the most commonly substantiated form of child maltreatment. If a child has not been provided for emotionally, physically and/or medically it is considered neglect. Infants and children who are labeled failure to thrive are often the result of neglect.

In the year 2000, two children were documented to have died as the result of child battering in Nebraska.

In Nebraska's network of Domestic Violence Sexual Assault Programs, there are 22 adult community-based programs. From July 1, 1999 through June 30, 2000 these programs provided information and support to 9,702 victims, including 3,564 children and adolescents. Of the 3,564 children and adolescents, 3,296 received services due to domestic violence and 268 received services due to sexual assault and/or incest.

The programs provided 123,738 meals to adults and children, and 1,705 adults and 2,334 children/adolescents were provided shelter (for a total of 45,757 shelter beds provided). Between July 1999 and June 2000, the programs received 118,953 calls to their crisis lines, 108,311 regarding domestic violence and 10,642 regarding sexual assault. Demographic information was provided by 5,838 victims, who reported 7,108 children living in the home. Of those 7,108 children living in the homes where the abuse took place, 5,870 witnessed the violence, 790 were physically harmed and 260 were suspected of being sexually abused.

There is a growing body of research indicating that children who witness violence are not only more likely to be abused themselves but those who are not directly abused are apt to exhibit the same problem behaviors and stress related difficulties as children who are directly physically harmed. Children in domestic violence situations behave more aggressively, exhibit more delinquent, withdrawn and anxious behavior and do not do as well in school and extracurricular activities as children from non-violent homes.¹

impact box

Some Facts About Domestic Violence and Children

- Women experiencing domestic violence are at least twice as likely to perpetrate physical abuse on their children as women who are not abused.²
- Fifty percent of men who abuse their spouses also abuse their children.³
- Fifty percent of all homeless women and children in the US are fleeing domestic violence.⁴

and Ec

Children from birth to age 8 are considered in the early childhood stage of life. During this critical period, children will grow and learn more than they will any other time in their lives. In order to make the most of this developmental stage children require high quality care. Young children who do not receive quality care may not reach their full potential resulting in less productive adult lives.

Head Start and Early Head Start programs are federally funded to provide comprehensive services in health and wellness, nutrition, education and social services to low-income families with infants, toddlers and preschool children. Early Head Start also serves pregnant teens and women preparing for the birth of their child. The four cornerstones of Head Start include: child development, family development, staff development and community development. Children participate in various program formats including: center-based, home-based or a combination of both to focus on the cognitive, social and emotional development in preparation for the transition to school. Research shows that Head Start children perform better in school and eventually in employment than those children of similar circumstances who did not participate in Head Start.

Recent early childhood brain research provided a catalyst to funding Early Head Start programs in this decade. Research has concluded that developmentally appropriate experiences contribute to the healthy development of an infant's brain and make a significant difference in whether a child may reach their full potential. Head Start and Early Head Start assist parents in helping their children reach their full potential through parenting education and support, mentoring, volunteering and employment opportunities and collaborations with other quality early childhood programs and community services.

In 2000, there were approximately 260 Head Start and Early Head Start classes in operation by 14 grantees in Nebraska with an actual enrollment of 5,340. Total funded enrollment is 4,470. Early Head Start enrollment, pregnant women and/or children ages 0 to 3, was 824. Head Start enrollment, children 3 to Kindergarten entrance, was 4,516. Of the child participants in both programs, 612 were identified as having special needs. Approximately 20% of enrollment includes children whose dominant language is not English.

Marlene, 2

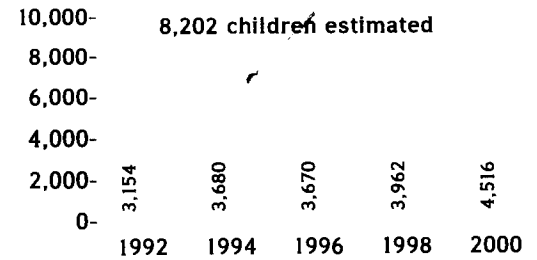

The American Indian Program Branch Head Start operates 14 classes within Nebraska's geographic borders. The Winnebago, Santee Sioux and Omaha Tribes are grantees with a total funded enrollment of 226, actual enrollment was 218. Migrant Branch Head Start operated 16 classes. The grantee is Panhandle Community Services in Gering. Migrant Head Start served 56 children in an Early Head Start program model and 32 children in Head Start. Total funded enrollment was 106 and actual enrollment was 88. Six children in Migrant Head Start were identified with special needs.

There are currently 23 counties in Nebraska that do not have Head Start programs or services. National Head Start expenditures totaled over \$5 billion in 2000. Head Start federal expenditures for Nebraska totaled \$26,857,614 in 2000. Currently, Head Start funding exists for about half of the 3 and 4 year old children who are eligible. About 10% of Head Start enrollment is for children with disabilities.

Education

How many of Nebraska's 8,202 eligible 3 and 4 year old children were enrolled in the Head Start Program?

1992-2000

Source: Region VII Administration for Children and Families

Since 1992, Early Childhood Projects have been serving young children and their parents. Ten Nebraska communities offer integrated child development programs by combining existing resources with small state grants of \$50,000 each. With local schools serving as fiscal agents and operating in cooperation with Head Start and other community agencies, these Early Childhood Projects currently serve nearly 500 children. Approximately half are able to participate through the state funding. Other children are supported through Early Childhood Special Education, Title I and Head Start. Programs include two serving parenting teens, two offering primarily parent education, five providing a part day program, and one full working day program. Funding for the programs was last increased in 1996.

In an effort to break the cycle of poverty and illiteracy and improve educational opportunities for families, the Even Start Literacy program integrates early childhood education, adult literacy or adult basic education, and parenting education. In 2000, 232 families received services through one of the seven federally funded Even Start Literacy programs in Nebraska.

In Nebraska, if a child care home or facility provides care for four or more children it must be licensed by Nebraska Health and Human Services Systems (HHSS). A total of 4,195 homes and facilities were licensed to provide child care in Nebraska as of December 2000. There has been a decrease of 879 licensed child care providers since 1996.

Dependent children and families up to approximately 185% of the federal poverty level (see Economic Well-being section of this report) can utilize child care subsidies. In 2000, HHSS subsidized the child care of at least 29,452 unduplicated children, an increase of 2,541 unduplicated children over 1999, with a monthly average of 15,229 children. With an average cost of \$1,640 per child, a total of \$47,725,819 federal and state dollars were used for child care subsidies in Nebraska. Subsidies are usually paid to the providers directly. We are pleased to report that once again in the year 2000 no families who applied and were found eligible had to wait for child care subsidies in Nebraska.

The average cost a family spends on child care is \$278 a month, over \$3,000 a year. The average cost of child care for preschool and school age children is between \$15.00 and \$21.00 per day while infant care is higher costing between \$15.00 and \$24.00 per day. Home-based care, a private residence where the child being cared for does not live, is typically less expensive than center-based child care. In-home care, the child care provider comes to the home of the child, is the most expensive, averaging approximately \$5.15 per hour. The full count of children receiving in-home child care is not included in the recipients counted above.

Children from birth through age 3 who have verified disabilities can receive services through their local school district in a collaboration between Health and Human Services and Education. During 1999-2000 school year, these Early Childhood Special Education and Early Intervention programs served 4,661 children ages 0 through age 5.

Nebraska's TANF Program

Aid to Dependent Children (ADC) remains the title of government "cash assistance" in Nebraska. TANF focuses on non-cash resources and education to foster self-sufficiency among program recipients. Nebraska's Employment First Program was created to assist parents in acquiring and sustaining self-sufficiency within 48 months. Through Employment First, cash assistance may be drawn for 24 of the 48 months. Medicaid coverage, child care services and job support are also available to ADC recipients.

In Nebraska, ADC was provided to a monthly average of 10,506 families totaling \$43,184,094, an average of \$342.55 per family in 2000. Unfortunately, the maximum ADC payment amounted to approximately 32% of poverty. These families had 20,176 children. Of the families receiving ADC, 6,601 were also provided Food Stamps. The utilization of ADC has been dropping since a peak of 17,239 families in 1993. While the public may assume that this reduction is due to a decrease in child poverty in Nebraska, we are uncertain of the cause. The 2000 long form census data, expected to be released in its entirety in Spring 2002, may provide a much clearer picture of poverty in Nebraska and nation wide.

Willy, 9

1990-2000

Source: HHSS
 Note: Average monthly participation levels.

In 2000, a total of \$134,145,000 was claimed as Earned Income Tax Credit on 87,454 Nebraska tax returns. The federal government created this tax credit in an effort to assist low and moderate-income working families in retaining more of their earned income.

Single parent families are less likely to have sufficient support systems and adequate financial sources than two parent families. Shortage of these essential resources has been linked with greater parental stress and therefore greater occurrence of child abuse. Research shows that over 50% of our nation's children will spend all or part of their childhood in a single parent household. Forty-five percent of single parent families headed by a woman and 19% of single parent families headed by a man live in poverty, as compared to only 8% of married couples with children under the age of 18.¹ In 1996, census estimates showed approximately 22% of Nebraska families were headed by a single parent.

Divorce accounts for 46% of all single parent households.² In 2000, 6,304 marriages ended in divorce, the majority, 55.5%, of these divorces involved one or more children. In 43.4%, or 2,734, of these cases, child support was awarded to the custodial parent. Unfortunately, the court-awarded child support is not always received by the custodial parent. A parent can request HHSS assistance if they are not receiving the child support that they are owed. HHSS responded to 72,446 of these cases in 2000 and collected \$13,255,034 on behalf of children who are dependent on Temporary Assistance to Needy Families (TANF). On behalf of children whose parents were also owed child support but were not receiving TANF, \$127,075,377 was collected.

In 36.7% (2,310) of year 2000 divorce cases, sole custody was awarded to the mother, in 5.1% (321) of the cases sole custody was awarded to the father and in 9.2% or 578 of the cases sole joint custody was awarded to both parents. The remaining custody cases were recorded as "unknown or other."

2000 Federal Poverty Guidelines

Note: The 1990 census estimates that 13% of all Nebraska children and 17% of Nebraska children under 5 live in poverty.

Christian, 4

High School Graduation

During the 1999 - 2000 school year, 21,917 Nebraska high school students were awarded diplomas. Eighty-two percent of the possible graduation cohort (26,479 1996-1997 9th graders) is estimated to have completed high school in 2000. Of these graduates, approximately 91% were white, 3.7% were black, 3.2% were Hispanic, 1.5% were Asian, and .5% were Native American or Alaska Native. GED or other certificates of high school completion were granted to 2,485 additional Nebraskans.

High School Dropouts

During the 1999-2000 school year, 3,774 (2.5%) of all Nebraska students dropped out of school, 2,196 male and 1,578 female. Minority groups carry higher drop out rates than white students, 6% of white students dropped out of school. While Hispanic students made up 6% of Nebraska students, grades K-12, they comprised over 13% of the dropouts. Six percent of the students were black but they were over 16% of the total dropouts.

Source: Nebraska Department of Education

During the 1999-2000 school year, 824 Nebraska students, grades 7-12, were offered alternative education opportunities in response to expulsion from the regular education program.

The School Discipline Act of 1994 requires expulsion for students found in intentional possession of a dangerous weapon and/or using intentional force in causing physical injury to another student or school representative. Students may be placed in an alternative school, class, or educational program upon expulsion from the regular program. The law encourages schools to provide alternative ways for expelled students to continue to make progress toward graduation. Prior to expulsion it is necessary for the student and his/her parents to develop a written plan outlining behavioral and academic expectations in order to be retained in an alternative program. Many schools are developing creative and motivating alternative programs to meet the needs of students.

During the 1999-2000 school year, 43,866 (13.3%) of Nebraska students received special education services based on a count taken on December 1, 2000. It is important for a child's development and education that the need for special education be identified at an early age. There were 3,309 preschool children birth to age 5 with a verified disability also receiving special education services. School districts reported 6,759 students ages 16-21 with disabilities.

impact box

- Dropouts comprise nearly half of the heads of households on welfare and a similar percentage of the prison population.
- In 1992, dropouts earned slightly under \$13,000 on average, about one-third less than high-school graduates.
- In 1992, the majority of school dropouts were in general high school program, very few were in college preparatory programs.
- Two out of every three Nebraska high school students complete the college preparatory program at their high school.

Amanda, 12

and

In the year 2000, there were a total of 24,643 live births in Nebraska. Nearly 7% (1,690) of these births were of low birth weight. Women age 19 and under became the mothers of 2,511 (10.2%) of the babies born, 6,697 (27.2%) were born to unwed parents and 4,112 (16.7%) were born to mothers who did not receive prenatal care during their first trimester of pregnancy.

According to the Centers for Disease Control and Prevention (CDC), nearly one third of American women who give birth will experience a pregnancy-related complication. Early and appropriate prenatal care can detect potential problems and may prevent serious consequences for both the mother and her baby. The CDC recommends starting prenatal care as early as possible, even prior to pregnancy. In 2000, 4,112 babies were born to Nebraska women who did not have prenatal care in the first trimester and 151 received no prenatal care during the entire pregnancy. Over 84% of white, 79.9% of Asian, and 66.7% of Hispanic newborns had mothers who received prenatal care in their first trimester of pregnancy.

From 1991-2000, 433 infants died of birth defects prior to their first birthday. There is a correlation between the health of the mother prior to conception and birth outcomes. Women can take steps to improve the chances of a healthy birth prior to conception by living a healthy lifestyle that includes eating nutritious foods rich with folic acid.

Low Birth Weight

The highest predictor of death and disability and the second leading cause of infant mortality in the United States is low birth weight. A newborn weighing below 2,500 grams (5.5 pounds) is considered of low birth weight and a newborn weighing less than 1,500 grams (3.3 pounds) is considered of a very low birth weight. In Nebraska, 6.9% (1,690) of newborns were of low birth weight, 1.3% (313) were born with a very low birth weight.

Currently, smoking is attributed to close to one-fifth of all low weight births and is the single most known cause of low birth weight. If no pregnant woman smoked cigarettes, up to 20% of all low birth weight births could be prevented. Other factors related to low birth weight are low maternal weight gain, low pre-pregnancy weight, maternal illnesses, fetal infections and metabolic and genetic disorders, lack of prenatal care and premature birth.¹

Sebastian, 1 month

impact box

Being born low birth weight may affect a child's ability to learn.

- Children who were born low birth weight are more likely than children of normal birth weight to have mild learning disabilities, attention disorders, developmental impairments and breathing problems, such as asthma.
- Children born very low birth weight have more learning problems and lower levels of achievement in reading, spelling and math than moderately low birth weight children.
- Approximately one-half of all very low birth weight children enroll in special education programs.

Source: <http://www.cdc.gov>

Behavioral

While teen birthrates have been falling in the United States, the Nation has the highest teenage pregnancy rate of all developed countries.² Research shows having children as a teenager can limit a young woman's educational and career opportunities, increase the likelihood that she will need public assistance and have negative effects on the development of her children.³ In Nebraska, 788 babies were born to girls age 17 and under in 2000, a total of 8,358 from 1991-2000. Across a ten year span, teens age 15-17 were the mothers of 7,967 babies and 391 were born to mothers under age 15. Of the babies born to teen mothers ages 10-17 in 2000, 605 had white mothers, 130 were born to black mothers, 29 had Native American mothers, 16 were born to Asian mothers and 8 were unknown or other. In addition to reporting race, mothers may claim ethnicity. In 2000, 138 babies were born to mothers with Hispanic ethnicity.

Nebraska Teen births in 2000 2,511 births to mothers 13-19 years of age

2 births to mothers age 12
5 births to mothers age 13
115 births to mothers age 14-15
666 births to mothers age 16-17
1,723 births to mothers age 18-19

Source: Vital Statistics

The risk of having children with adverse birth outcomes, such as low birth weight and infant mortality, is greater for unmarried mothers than for married mothers. Children born to unmarried mothers are also more likely to live in poverty than children born to married couples.⁴ The likelihood that a mother will be married upon the birth of the child increases with the age of the mother up to age 35. In 2000, 94.2% (742) of the mothers age 17 and under were not married upon the birth of their child.

The national goal set by the CDC is that 90% of all children be immunized (except for preschool boosters) by the age of two. According to the National Immunization Survey for calendar year 2000, 75.5% of Nebraska two-year-olds have received four DTP (diphtheria-tetanus-pertussis shots), three polio shots, one MMR (measles-mumps-rubella shot), three Hib (H. influenza type b), and three Hepatitis B. immunizations. The U.S. national average was 72.8%. Individual antigen rates for varicella (chicken pox) vaccine were 63.5%. The U.S. national average for varicella vaccine was 67.8%.

Jack, 6 month immunizations

There were 32 cases of pertussis (whooping cough) reported in Nebraska in 2000. This is an increase of 18 cases of pertussis over the 14 reported occurrences in 1999. From 1993-2000 there have been 144 total cases in Nebraska. Generally the disease does not have a strong effect on older children or adults; however, it can be easily passed to young children who may end up hospitalized or worse. Although there have been no deaths in recent years, pertussis is a potentially deadly disease for young children.

Infant mortality rates are frequently used as an indicator of overall human well-being in a community. Although the United States spends more on health care than any other country, it still has a higher infant mortality rate than 21 other industrialized nations.⁵ In 2000, the infant mortality rate, deaths per 1,000 births, was 7.2, an increase from 6.8 in 1999. In 2000, 178 children died prior to their first birthday.

Nebraska residents lost 1,798 babies under the age of one from 1991-2000. Birth defects, 24%, were the number one cause of infant death in Nebraska in 2000, while 17% of deaths were attributed to Sudden Infant Death Syndrome (SIDS). Infant mortality rates are generally higher for minority populations. In 2000, white Nebraskans experienced an infant mortality rate of 6.3; while blacks experienced a rate of 20.4, Native Americans 16.4, and those of Hispanic origin had a rate of 7.3. The high infant mortality rates among minorities, especially black Americans, are related to a life long minority status.⁶

In Nebraska close to half of child deaths are attributed to accidents. In 2000, 33% of the 174 total child deaths, children age 1-19, were due to motor vehicle accidents and approximately 10% were due to non-motor vehicle accidents. Eleven deaths were attributed to cancer, 18 children were lost to suicide and 21 to homicide in 2000. Two of the child homicides were attributed to child battering totaling 14 child battering deaths from 1991-2000. Substance abuse is often associated with suicide and homicide deaths.

**Selected Causes of Death, by frequency
Ages 1-19 in Nebraska, 1991-2000**

Causes	Frequency
Motor Vehicle Accidents	606
Non Motor Vehicle Accidents	266

Kyle, 7 Insured by Kids Connection

Uninsured children tend to live in employed families who do not have access to insurance. Often the employer does not offer insurance, the insurance offered is too expensive or the insurance does not cover all of the necessary medical needs of the family. Many of these uninsured children are eligible for Kids Connection. Kids Connection provides free health care coverage for children living in families at or below 185% of the federal poverty level. Kids Connection includes both the State Children's Health Insurance Program (SCHIP) and the Nebraska Medical Assistance Program (Medicaid). Kids Connection provided health coverage for 120,041 Nebraska children in 2000, approximately 26% of all Nebraska children 18 and under. Before the SCHIP took effect in 1998, HHS estimated 24,000 Nebraska children were without health coverage and living in families with incomes below 185% of the poverty level. From September 1998 through December 2000, enrollment in the Kids Connection program increased by 32,271 with a total enrollment of 120,041. In September 2000, an estimated 12,000 income-eligible Nebraska children remained uninsured.

Blood Lead Levels

Blood lead testing is recommended for all children at 12 to 24 months of age. In 2000, only 13,294 children were reported having been tested for elevated blood lead levels and 518 were considered to have blood lead levels in the range where detrimental effects on health have been clearly demonstrated. Of the children tested during 1998, 1999 and 2000, minority children had a higher likelihood of having elevated blood lead levels. During the three year period, 3,127 African American children were tested with 11.2% having elevated blood lead levels, while of the 13,044 white children tested a lower 3.4% had high lead levels. Approximately 9.2% of the 3,573 Hispanic children tested and 6.3% of the 458 Native American children tested had elevated blood lead levels. Increased behavioral problems, malnutrition, significant detrimental physical and cognitive development problems can be attributed to elevated blood lead levels. Severe cases of lead poisoning can be fatal.

Children are commonly exposed to lead through deteriorated lead-based paints often present in houses built prior to 1950. Some homes built as recently as 1978 may also contain lead-based paint. The best way to protect children who are at risk is to properly maintain painted surfaces, thereby eliminating chipping and peeling paint. It is also beneficial to keep a child's home clean and dust free.

impact box

Lack of health insurance for children may impact their school performance.

- Most children in America's classrooms who are uninsured are eligible for low-cost or free children's health insurance.
- Uninsured children are less likely to receive proper medical care for sore throats, earaches and asthma – common childhood illnesses that are often the cause of school absences.
- One out of three uninsured children with recurring ear infections never see a doctor during the year.
- One in five uninsured children have untreated vision problems.

Source: The Future of Children

Nathan, 9 and Joe Joe, 2

The Nebraska Health and Human Service System (HHSS) funds some mental health and substance abuse services for children. Children who utilize these services are most often from lower income Nebraska families or are involved in the court system. Services paid for by private insurance are not included in the data and, therefore, the total is an underestimation of the number of children provided these services.

During fiscal year 2000, the Lincoln Regional Center (LRC) served 47 Nebraska youth in their inpatient psychiatric program, 78 youth in the Adolescent Psychiatric Residential Program, 195 youth received services from the Adolescent OJS Program and 31 youth received services from the LRC Adolescent Sex Offender Community Residential Program. During fiscal year 2000, the Hastings Regional Center opened a program providing substance abuse treatment services for youth served at the Youth Rehabilitation and Treatment Centers (YRTC's). During the fiscal year, 42 youth were served in this program. No youth were served at the Norfolk Regional Center in 2000.

Out-patient programs with counseling for mental health and/or substance abuse, substance abuse prevention, partial care and halfway house services, mental health day treatment, emergency psychiatric service and therapeutic group home services are publicly funded services available through community-based organizations.

Mental health and substance abuse services through community-based programs were received by 3,858 Nebraska children ages 0-18 in 2000. Out of those children 2,909 received mental health services, 861 received substance abuse services and 88 received both mental health and substance abuse service. The Professional Partner Program served 607 children considered to have serious emotional disturbance.

Recently, Herz and Poland, researchers at the University of Nebraska – Omaha collaborated with Nebraska State Probation to assess the prevalence of mental health problems and substance abuse among adjudicated offenders court ordered to complete a Pre-Disposition Investigation. All offenders completing a PDI during the two-month study were asked to complete the Massachusetts AYSI-2, which was designed to identify potential mental health problems and the need for further evaluation.

Preliminary results from this study provided some insight into the role of mental health problems among this population. The table shows the results from the MAYSI-2. According to these findings, between one-quarter to one-third of these offenders reported enough symptoms to fall into the “caution” or “warning” categories for three of the four mental health scales. Particularly concerning, however, is the noticeable percentage of offenders (14%) that fell into these categories for Suicide Ideation.

Prevalence of Mental Health Problems among Juvenile Offenders at the Pre-Disposition Stage using the MAYSI-2 Screening Instrument (N=232)

	Percent at or above “Caution” Cut-Off	Percent at or above “Warning” Cut-Off	Total in Potential Problem Range
Angry/Irritable	17%	13%	30%
Depressed/Anxious	17%	6%	23%
Somatic Complaints	31%	4%	35%
Suicide Ideation	3%	11%	14%

This study documents the prevalence of mental health problems among juvenile offenders. Although these findings are based on the results of screening tools, they provide a starting point for discussing the role of treatment (i.e., access and appropriateness) within the Nebraska Juvenile Justice System. For more information on the offenders’ access to substance abuse and mental health treatment, see Herz & Poland (Forthcoming) *Assessing the Need for and Access to Mental Health Treatment Among Juvenile Offenders in Nebraska*.

The most recent Youth Risk Behavior Survey (YRBS) was conducted in 1999. Several large urban districts declined to participate; therefore urban youth in Nebraska may be under-represented by this sample. The YRBS is funded by a grant from the CDC and administered by HHS. The purpose of the YRBS is to monitor priority health-risk behaviors that contribute to the leading causes of death, disease and social problems among youth and adults. Much of the following data is based on this survey.

Brandon, 15

Alcohol, according to the YRBS, is the most frequently used substance among Nebraska teens. Fifty-six percent of the youth surveyed had consumed alcohol in the last 30 days prior to the survey, 43.7% of the boys and 38% of the girls had binged (drinking 5 or more drinks in a row) on alcohol. According to the YRBS 1999 report, approximately half of all motor vehicle crashes and homicides and suicides among youth involve alcohol. The report goes on to say that youth alcohol use is associated with increased occurrence of multiple sexual partners, marijuana use and lower academic performance. Some of the other drugs youth utilized were marijuana (31%), inhalants such as glue, paints or aerosols (13%), methamphetamines (8%) and cocaine (7%).

According to the US Department of Health and Human Services, the most preventable cause of death in the nation is tobacco use. In Nebraska, 37% of the students surveyed reported smoking cigarettes, 20% smoked cigars, cigarillos, or little cigars, and 12% had chewed tobacco or snuff at least once in the past 30 days.

Of the adolescents surveyed, 38% reported that they had experienced sexual intercourse at least one time in their life and 32% of the adolescents who reported having had sexual intercourse used alcohol or drugs prior to their last sexual intercourse. While the majority of these teens, 63%, reported using a condom the last time they had sexual intercourse, lessening their chances of contracting a sexually transmitted disease or producing pregnancy, 37% did not. Twenty-six percent of the respondents reported having had sexual intercourse in the past three months and 26% have had intercourse with four or more people during their life.

According to HHS, of the children age 19 and under in 2000, 2,164 (33% of the 6,494 total reported cases for all age groups) were reported to have a sexually transmitted disease (STD), 20 were reported HIV positive, and 17 were reported with having AIDS.

The leading cause of deaths among Nebraska youth age 15-19 is automobile crashes. Although Nebraska's legal drinking age is 21, 20% of all drivers involved in alcohol-related motor vehicle accidents were between the ages of 15 and 20 in 2000. According to the YRBS, 46% of students reported riding in a vehicle driven by someone who had been drinking alcohol and 26% had driven a motor vehicle themselves when they had been drinking alcohol.

The statutory intent of Nebraska's juvenile justice system is to provide individualized accountability and individualized treatment for juveniles in a manner consistent with public safety to those juveniles who violate the law. It is also to promote prevention efforts through the support of programs and services designed to meet the needs of those juveniles who are identified as being at risk of violating the law and those whose behavior is such that they endanger themselves or others. There is a list of eleven goals to be accommodated through the range of programs and services that are to be provided by the juvenile justice system.

When examining the information provided here on juvenile justice, it is important to remember that the juvenile justice "system" is comprised of various components and entities, which are not all under the same administration. Local law enforcement agencies are usually the first point of contact with an arrest for an offense committed by the juvenile. Probation, which is actually an arm of the court, will often be the next entity involved as they do a risk assessment to determine if the youth should be detained in a juvenile facility or can safely be returned to caregivers. The county attorney then makes a decision to prosecute. The court hears the case. Health and Human Services' Office of Juvenile Services (OJS) will then become involved if the juvenile is a status offender requiring services or is placed at a facility such as the Youth Rehabilitation and Treatment Centers (YRTC) in Geneva or Kearney, which are under OJS. After completing treatment the juvenile will usually be paroled and overseen by a juvenile services officer who is also under OJS. A violation of that parole (for both a status offender and a delinquent may result in the process beginning all over again with an arrest, another probation assessment, etc.

There is no single juvenile justice information system from which to gather and analyze data. This presents a challenge when trying to provide a clear picture of the systems in our Kids Count Report and also makes it difficult for effective juvenile service planning.

Juvenile Arrests

In 2000, 18,782 Nebraska juveniles were arrested, a 7% decrease from last year. Male offenders make up over 70% of all juvenile arrests, mirroring adult male offenders who make up over 75% of all adult arrests. The most frequent causes of arrest (male or female) are larceny/theft and liquor law violations.

Probation

In 2000, 5,956 of Nebraska juveniles were on probation. This is a decrease of 1,256 juveniles on probation in 1999. Many, 1,054, of the juveniles supervised in 2000 were adjudicated in adult court and 1,786 were supervised for sex offenses. Statewide, 2,482 youth satisfactorily completed probation.

Some days I'm the color of the light blue sky

Pretty and beautiful like the birds up high

Instead of sitting around and throwing a fit

To the commands of adults I do submit

This is the time I am most at peace

In my heart I feel at ease

Most days I am red hot, listen to adults,
I think not

I'd rather sit and fight all the time

To prove I'm in control,
and my life's rightfully mine

I usually don't care if it's the right place
and time

This is just my time of strife

Well, there it is...the color of my life

Tatiana, 15

The Youth Rehabilitation and Treatment Centers were established in Kearney in 1879 and in Geneva in 1892. Their current mission is for Kearney: To provide each youth with the supervision, care and treatment that affords him the opportunity to become a law-abiding and productive citizen and for Geneva: To protect society through the various component areas that will help each youth to substitute socially acceptable behavior for previous delinquent conduct.

There were 600 males at Kearney and 159 females at Geneva for a total of 759 youth in YRTC care from July 1999 – June 2000. Geneva provides for an average of 92 females a day averaging 16 years old. The average amount of time a juvenile spent in Geneva was 7 months and Kearney was 147 days or almost 5 months. Sixty-nine percent of Geneva admissions were Caucasian, 12% were African American, 12% were Hispanic and 7% were Native American. Approximately 62% of the juveniles committed to Kearney were Caucasian, 18% were Hispanic, 14% were African American, 4% were Native American under 1% were Asian and 0.2% were other.

The Nebraska Crime Commission received 432 reports and supplement reports for rape (forcible and attempted) in 2000. All Nebraska law enforcement agencies voluntarily submit a supplemental report on each rape reported providing details of the incident with the exception of the Omaha Police Department. Eighty-four (excluding Omaha) of the rape victims were age 17 and under.

As of June 30, 2000, 84 Nebraska youth under the age of 18 were in adult prisons. Of these juveniles, roughly 42% were incarcerated for robbery, burglary or theft while the remaining were held for drug offenses, weapon offenses, sex offenses and homicide. Six youth were held for homicide in 2000. As of June 30, 2000, there were 7 youth on parole from adult prisons. Studies show trying juveniles in adult court has not been found to be an effective intervention in reducing juvenile crime, however it is used nationally. Youth who are tried in adult court may be incarcerated in adult prisons.

Food Stamps are provided by the USDA to aid families who have incomes at or below 130% of poverty in maintaining a low-cost and healthy diet. Nebraska Health and Human Services (HHS) distributed Food Stamps to 85,262 persons or 36,214 households monthly in 2000. An average of \$145.01 per household and \$61.59 per person was received monthly totaling \$63,015,015 for the year. There were 41,994 children ages 0-17 found eligible to receive Food Stamps.

Families are eligible for free or reduced price lunches based on their income level through the USDA School Lunch Program. Families must have an income at or below 130% of poverty to receive free lunch and at or below 185% of poverty to receive reduced price meals. Through this program the USDA subsidizes all lunches served in schools. During the 2000-2001 school year 460 of the 793 school districts offered school lunches. An average of 77,714 children received free and reduced price lunches. Unfortunately, 93,914 children were found eligible for free and reduced price lunches leaving 16,200 eligible children not participating in school lunch. The Department of Education does not track how many children are eligible for reduced price or free school meals if the school does not offer meals, therefore the number of children who are eligible but do not have access to meals at their school is not available. A total of 208,639 children participated in the school lunch program in Nebraska.

The USDA provides reimbursements to schools for breakfast as is done for lunch. During the 2000-2001 school year 443 schools in 162 districts participated in the school breakfast program, leaving 1,134 schools in 631 districts that do not offer breakfast. An average of 35,910 students benefited from the breakfast program. An average of 22,103 students received free breakfast while 3,903 students were charged a reduced price for their school breakfasts. A total of \$33,824,071 was spent for all breakfasts and lunches in fiscal year 2000.

During the summer months children may not get the nutrition that is available to them during the school year through the USDA school meal programs. The USDA Summer Food Program was

KeiAndre, 11

created to meet the nutritional needs of children and low-income adults during the summer. A total of 7,100 Nebraska children participated in the SFSP in 2000. Only 15 counties offer the SFSP with 80 sites available. This is a decrease of 23 sites from 1999. Due to 24 of the sites offering two meals daily the actual unduplicated number of child participants may be lower than the total given. One child may be counted twice for receiving both breakfast and lunch daily.

The USDA purchases surplus commodities through price support programs and designates them for distribution to low-income families and individuals through food banks, soup kitchens and pantries. In 2000, 61,156 Nebraska households were served through the Commodity Distribution Program, an average of 5,097 households per month. A monthly average of 47,852 meals were served in soup kitchens through this program, totaling 574,224 meals.

In 2000, an average of 12,438 daily lunches were provided in child and adult care centers and 17,481 in homes through this food program.

Women who are pregnant, breast-feeding and postpartum or families with infants and children up to age 6, who are at or below 185% of poverty are eligible for the USDA Commodity Supplemental Foods Program. The program provides surplus commodity foods such as non-fat dry milk, cheese, canned vegetables, juices, fruits, pasta, rice, dry beans, peanut butter, infant formula and cereal to eligible participants. A monthly average of 1,376 women, infants and children were served by CSFP totaling 17,888 food packages for fiscal year 2000. Seniors age 60 or older who are at or below 130% of poverty may also participate in the program. Seniors received 144,420 food packages averaging 12,035 per month. There are 69 CSFP distribution sites serving all 93 counties.

CSFP – Fiscal Year 2000

Average Monthly Served	225	57	1,094	12,035	13,411
Total Food Packages	2,700	684	13,128	144,420	160,932

Source: HHSS

The Special Supplemental Nutrition Program for Women, Infants and Children (WIC) is a short-term intervention program designed to influence lifetime nutrition and health behaviors in a targeted, high-risk population. WIC served an average of over 7.2 million participants per month through 10,000 clinics nationwide in 2000. WIC provides supplemental foods such as milk, juice, cheese, eggs and cereal to Nebraska's pregnant, postpartum and breastfeeding mothers, infants and children up to age five who have a nutritional risk and meet the income guidelines of up to 185% of poverty. Parents, guardians and foster parents are encouraged to apply for benefits. The Nebraska WIC Program served 56% of the estimated income eligible persons for 2000 based on average monthly participation. Of the 24,949 babies born in Nebraska in 2000, 40% (9,916) were on WIC. Participation has been fairly steady over the past 4 years (1997-2000). Average participation per month was 32,194 women, infants and children in 2000. Studies have shown Medicaid costs were reduced on average between \$12,000 and \$15,000 per infant for every very low birth-weight (less than 1500 grams) prevented. Costs for food benefits and nutrition services average approximately \$600 per year for a pregnant woman on WIC. WIC children demonstrate better cognitive performance. Participation in the program helps ensure children's normal growth, reduce levels of anemia, increase immunization rates, improve access to regular health care and improve diets.

WIC Participants

Year	Average Monthly Program Participants
1990	20,641
1991	25,915
1992	28,714
1993	31,885
1994	33,592
1995	35,059
1996	35,376
1997	32,351
1998	31,107
1999	32,379
2000	32,194

Chance, 6 weeks old, in WIC office in the PanHandle.

“Having WIC has been great, not only financially but the good information they provide. So much has changed since I had my first child.”

-Raelynn

Nebraska children may be placed in out-of-home care as a result of parent/guardian abusive or neglectful behavior or their own delinquent or uncontrollable behavior. Nebraska Health and Human Services (HHS) is responsible for most of the children in out-of-home care because they are court ordered into care as wards of the state. There are a small number of children placed in private residential facilities who are not considered wards of the state. A child in out-of-home care may reside in a variety of placements such as foster homes, group homes, residential treatment facilities or juvenile correction facilities.

In 1982, the FCRB was created as an independent agency responsible for reviewing the plans, services, and placements of children who have been in out-of-home care for six months or longer. A staff of over 350 trained citizen volunteers serve on local FCRB boards to engage in this important review process. Completed reviews are shared with all case involved legal parties. The FCRB also has an independent tracking system for all children in out-of-home care, and regularly disseminates information on the status of Nebraska children in out-of-home care. With the exception of the approved and licensed foster care home data and adoption data, all of the data in this section was provided by the FCRB through their independent tracking system.

In 2000, there were a total of 10,838 Nebraska children in out-of-home care. On January 1, 2000 there were 5,557 children in out-of-home care, during the year 5,281 entered care while 4,328 exited leaving 6,286 children in care on December 31, 2000. Of the 5,281 children who entered care in 2000, 2,405 or 45% were placed in out-of-home care for the first time and 2,876 for the second or more times. Of the 6,286 children on December 31, 2000, 5,639 were HHS wards.

Neglect is the most commonly recorded cause for removal of a child from their parent or guardians home. Neglect has several forms that range from outright abandonment to inadequate parenting skills which effect child well-being. The child's behavior is the second most prevalent cause of placement followed by physical abuse.

There are a variety of placement possibilities for children in out-of-home care. Of the 6,286 children in care on December 31, 2000, there were 2,501 (approximately 40%) in foster homes, 1,123 in group homes or residential treatments centers, 884 placed with relatives, 583 in jail/youth development center and 267 in emergency shelter. The remaining children were involved in Job Corp/school or lived in pre-adoptive homes, centers for the disabled, psychiatric, medical, or drug/alcohol treatment facilities, or child caring agencies. Lastly, 118 were runaways/whereabouts unknown and 62 were living independently as they were near adulthood.

Rachel, 13 Adopted

Reasons Children Entered Out-of-Home Care in 2000

Neglect	3,207
Child's Behaviors	942
Physical Abuse	801
Parental Substance Abuse	779
Child's Physical or Emotional Needs	430
Other	320
Sexual Abuse	306
Emotional Abuse	226

**Up to three reasons are allowed for each child therefore the numbers may be duplicated*

Source: State Foster Care Review Board

and

As of June 2000, there were 1,528 licensed foster homes, decrease from past years. The number of approved foster homes continues to rise with 1,861 an increase of 463 homes from 1999. This increase has helped make up for the lack of licensed foster homes, however this may cause additional concerns. All foster homes are required to pass background checks consisting of reference checks, a local criminal record check, and child abuse registry checks. Licensed providers must participate in a series of interviews and complete initial and ongoing training. Approved providers are usually relatives or individuals who have known the child or family prior to placement and are not required to pass the same approval process as licensed providers. Due to the lack of training required, approved providers may provide care for the child or children from one family only. Approved providers must pass an in-home evaluation.

According to HHS, a total of 3,389 approved and licensed foster homes were available in Nebraska in 2000. Foster care providers are desperately needed for older children and children with special needs. Individual homes are the most ideal and least institutionalized environment for children placed in out-of-home care.

Unfortunately, it is typical for a child to be moved repeatedly while in out-of-home care. The FCRB tracking system counts each move as a placement; therefore, if a child was placed in a foster home, then sent to a mental health facility, then was placed in a different foster home, three placements would be counted; however, a hospitalization for an operation would not be counted. Again the ideal situation for a child placed in out-of-home care is to experience only one placement creating the consistency recommended for positive child well-being.

Number of Placements Experienced by Children in Out-of-Home Care

Number of Placements	In Care on Dec. 31, 1990	In Care on Dec. 31, 2000
4 or more	32.5% (1,570 of 4,832)	48.1% (3,026 of 6,286)
6 or more	20.3% (981 of 4,832)	33.0% (2,071 of 6,286)

impact box

HHS Protection and Safety caseworkers completed a survey for each child on his/her caseload on November 30, 2000, including children placed in out-of-home care. Completed surveys were reviewed by Protection and Safety Supervisors and the HHS Deputy Director for Protection and Safety.

According to this point in-time survey, about 42% of the youth in out-of-home care had no mental or physical diagnosis reported. 15% had a Depressive Disorder, 15% had an

Oppositional Defiant Disorder, 13% and a Conduct Disorder, 13% had an Attention Deficit/Hyperactivity Disorder or a Disruptive Behavior Disorder. These diagnoses are reflective of the kind of diagnoses a child with a background of abuse, neglect, status offenses, or delinquent behavior may have. Please note that 42% of the children did not have a reported diagnosis. Many children who are in out-of-home care and both mentally and physically healthy and well adjusted.

Source: HHSS

Minority children continue to be over-represented in the Nebraska out-of-home care system. Minority children make up approximately 14% of Nebraska's child population (according to 1998 census estimates), however they represent approximately 25% of children in out-of-home care.

Out-of-Home Care Children by Race (December 31, 2000)

Race	Percent in Care
White	59.3%
Black	17.3%
Other/not known	7.7%
Native American	7.6%
Hispanic	6.8%
Asian	1.3%

Source: State Foster Care Review Board

Adoption is the preferred permanency plan for children who cannot be safely reunited with their biological family. In 2000, there were 402 adoptions finalized in Nebraska agencies, an increase over the 380 adoptions finalized in 1999. Subsidies are available to help remove some barriers associated with adopting children who are older, need to be placed with one or more siblings, are of minority races or who have special behavioral, emotional or physical needs.

Mark, 16

Governor Mike Johanns announced that Nebraska received \$140,684 as an adoption incentive bonus because of a 47% increase in the number of adoptions of children who are state wards. The bonus was awarded by the U.S. Department of Health and Human Services, and is part of the Adoption and Safe Families Act of 1997.

In 2000, Legislative Bill 209 was enacted requiring culturally sensitive training for the foster parents of Native American children.

Data Sources: Sources for all data are listed below by topic. In general, data was obtained from the state agency with primary responsibility for that population and from reports of the U.S. Bureau of Census and the U.S. Department of Commerce. With respect to population data, the report utilizes data from the 1990 U.S. Census of Population and Housing (STF3A). 2000 Census data will be available in the late spring of 2002. Please check our web site for information. www.voicesforchildren.com

Race – Race/Hispanic identification – Throughout this report, race is reported based on definitions used by the U.S. Bureau of Census. The census requests adult household members to specify the race for each household member, including children. The racial categories provided are White, Black, American Indian/Eskimo/Aleut, Asian/Pacific Islander, and Other Race. These racial categories are mutually exclusive; all persons are expected to respond with a single category. The census treats Hispanic origin as a separate category and Hispanics may be of any race. In Nebraska, the great majority of Hispanic householders classify themselves as of either White or Other Race.

Rate – Where appropriate, rates are reported for various indicators. A rate is the measure of the likelihood of an event/case found in each 1,000 or 100,000 “eligible” persons. (Child poverty rates reflect the number of children living below the poverty line as a percentage of the total child population.)

Selected Indicators for the 2001 Report – The indicators of child well-being selected for presentation in this report reflect the availability of state data, the opinion and expertise of the Kids Count in Nebraska project consultants and advisors, and the national Kids Count indicators.

Data Sources: Data was provided by the Nebraska Health and Human Services System, (NHHSS) and the Nebraska Domestic Violence/Sexual Assault Coalition. Data regarding hospital discharges was provided by vital statistics. Abuse fatalities data was provided by vital statistics.

Neglect – Can include emotional, medical, physical neglect, or failure to thrive.

Substantiated Case – A case has been reviewed and an official office or court has determined that credible evidence of child abuse and or neglect exists. Cases are reviewed by NHHSS and/or an appropriate court of law.

Agency Substantiated Case – NHHSS determines a case to be substantiated when they find indication, by a “preponderance of the evidence” that abuse and/or neglect occurred. This evidence standard means that the event is more likely to have occurred than not occurred.

Court Substantiated Case – A court of competent jurisdiction finds, through an adjudicatory hearing, that child maltreatment occurred. The order of the court must be included in the case record.

Domestic Violence Shelter – Shelters (public or private) for women and children whose health/safety are threatened by domestic violence.

Data sources: Parents in the workforce data was taken from the U.S. Census of Population and Housing, 1990. Data concerning child care subsidies and licensed childcare was provided by NHHSS. Data concerning Head Start was provided by the Administration for Children and Families, U.S. Department of Health and Human Services, Office of Family Supportive Services, Head Start and Youth Branch. Data concerning early childhood initiatives was obtained from the Nebraska Department of Education web site for Early Childhood.

Child Care Subsidy – NHHSS provides full and partial child care subsidies utilizing federal and state dollars. Eligible families include those on Aid to Families with Dependent Children and families at or below approximately 185% of poverty. Subsidies are paid directly to a child care provider.

Licensed Child Care – State statute requires NHHSS to license all child care providers who care for four or more children from more than one family on a regular basis, for compensation. A license may be provisional, probationary or operating. A provisional license is issued to all applicants for the first year of operation.

Center Based Care – Day care centers which provide care to many children from a number of families. State license is required.

Family Child Care Home I – Provider of child care for 4 to 10 children. State license is required. This licensure procedure begins with a self-certification process.

Family Child Care Home II – Provider of child care serving 12 or fewer children at any one time. State license is required.

Head Start – The Head Start program includes health, nutrition, social services, parent involvement, and may include transportation services. This report focuses on the largest set of services provided by Head Start – early childhood education.

Data Sources: Data related to Temporary Assistance to Needy Families, Kids Connection income guidelines, poverty guidelines, and child support collections was provided by NHHSS. Data concerning divorce and involved children was taken from Vital Statistics provided by NHHSS. Data enumerating the number of children in low income families and cost burden for housing was taken from the 1990 Census of Population and Housing, STF3A. Data on the Earned Income Tax Credit program was provided by the Department of Revenue.

Data Sources: Data on high school completion, high school graduates, secondary school dropouts, expulsions, and children with identified disabilities was provided by the Nebraska Department of Education.

Dropouts – A dropout is an individual who: A) was enrolled in school at some time during the previous year, or B) was not enrolled at the beginning of the current school year, or C) has not graduated from high school or completed a state or district-approved educational program, or D) does not meet any of the following exclusionary conditions; 1) transfer to another public school district, private school, or state or district-approved

educational program, 2) temporary absence due to suspension or school-approved illness, or 3) death.

High School Completion – The high school completion rate is a comparison of the number of children starting high school and the number of graduates four years later. This comparison does not account for transfers in and out, deaths, or temporary absences.

Expulsion – Exclusion from attendance in all schools within the system in accordance with sections 79-254 to 79-296 (Student Discipline Act). Expulsion is generally for one semester unless the misconduct involved a weapon or intentional personal injury, for which it may be for at least a calendar year.

Special Education – Specially designed instruction to meet the individual needs of children who meet the criteria of a child with an educational disability provided at no extra cost to the parent. May include classroom support, home instruction, instruction in hospitals and institutions, speech therapy, occupational therapy, physical therapy, and psychological services.

APPLICABLE FEDERAL AND STATE LAWS

Data Sources: Data for Medicaid participants was provided by NHHSS. Data related to pertussis, immunizations, STD's, and blood lead levels was provided by NHHSS. Data related to infant mortality, child mortality, and births is based on NHHSS 2000 Vital Statistics Report. Data related to adolescent risk behaviors, sexual behaviors and use of alcohol, tobacco, and other drugs are taken from the 1999 Youth Risk Behavior Survey. Data enumerating motor vehicle accident related deaths and injuries was provided by the Nebraska Department of Roads.

Data pertaining to children receiving mental health and substance abuse treatment in public community and residential treatment facilities was provided by NHHSS.

Prenatal Care – Data on prenatal care is reported by the mother and on birth certificates.

Low Birth Weight – A child weighing less than 2,500 grams, or approximately 5.5 pounds at birth.

JUVENILE JUSTICE

Data Sources: Data concerning total arrests and the number of juveniles in detention centers was provided by the Nebraska Commission on Law Enforcement and Criminal Justice (Crime Commission). Data concerning juveniles currently confined, on parole or committed to Youth Rehabilitation Treatment Centers (YRTC) was provided by the NHHSS, Office of Juvenile Services. Data on youth committed to YRTC programs was provided by HHS. Data on youth in the adult corrections system was provided by the Department of Corrections. Data on youth arrested/convicted of serious crimes and juvenile victims of sexual assault was provided by the Crime Commission. Data concerning juveniles on probation was provided by the Administrative Office of the Courts and Probation.

Arrests, Part I Offenses – There are two categories of serious crimes: violent crimes and crimes against property. Violent crimes include the following: murder/manslaughter, death by negligence, forcible rape, robbery and felony assault. Crimes against property include: burglary, larceny-theft, motor vehicle theft and arson.

Arrests, Part II Offenses – The following crimes are included: Misdemeanor assault, forgery and counterfeiting, fraud, embezzlement, stolen property, vandalism, weapons offenses, prostitution and commercialized vice, sex offenses, drug offenses, gambling, offenses against family, driving under the influence, liquor offenses, disorderly conduct, vagrancy, curfew and loitering law violations and runaways.

Juvenile Detention – Juvenile detention is the temporary and safe custody of juveniles who are accused of conduct subject to the jurisdiction of the Court, requiring a restricted environment for their own or the community's protection, while pending legal action.

Youth Rehabilitation and Treatment Center (YRTC) – A long-term, staff secure facility designed to provide a safe and secure environment for Court adjudicated delinquent youth. YRTC is designed to provide services and programming that will aid in the development of each youth with a goal of successfully reintegrating the youth back into the community.

FOOD INSECURITY

Data Sources: Data on households receiving food stamps, the USDA Special Commodity Distribution Program, the USDA Commodity Supplemental Foods Program, and the WIC Program was provided by NHHSS. Data related to the USDA Food Programs for Children was provided by the Nebraska Department of Education.

OUT-OF-HOME CARE

Data Sources: Data was provided by NHHSS and the Foster Care Review Board.

Approved Foster Care Homes – NHHSS approves homes for one or more children from a single family. Approved homes are not reviewed for licensure. Data on approved homes had been maintained by NHHSS since 1992. Often these homes are the homes of relatives.

Licensed Foster Care Homes – Must meet the requirements of the NHHSS. Licenses are reviewed for renewal every two years.

Out-of-Home Care – 24-hour substitute care for children and youth. Out-of-home care is temporary care until the child/youth can be returned to his or her family, placed in an adoptive home, receive a legal guardian or reach the age of majority. Out-of-home care includes the care provided by relatives, foster homes, group homes, institutional settings and independent living.
